TNT First Day Kahoot

12 multiple-choice questions. Correct answer in green bold.

1. What does EEG measure?

1. Muscle strength
2. Blood flow in the brain
3. **Brain electrical activity at the scalp (correct)**
4. Heart rate

2. What does the EMG band we just used measure?

1. Brain waves
2. Eye position
3. Skin temperature
4. **Muscle electrical activity (correct)**

3. Closing your eyes boosts which rhythm at the back of the head?

1. Beta (13-30 Hz)
2. **Alpha (8-12 Hz) (correct)**
3. Delta (1-4 Hz)
4. Gamma (30+ Hz)

4. Imagining moving your RIGHT hand weakens the mu rhythm at which electrode?

1. Oz (back)
2. Fz (front)
3. **C3 (left side) (correct)**
4. C4 (right side)

5. SSVEP (staring at a flickering light) is strongest over which area?

1. Frontal lobe (forehead)
2. **Visual cortex (back of head) (correct)**
3. Motor cortex (top)
4. Temporal lobe (sides)

6. The P300 brain response shows up about how long after a target?

1. 3 seconds
2. 30 seconds
3. **0.3 seconds (correct)**
4. 0.03 seconds

7. Chance accuracy for a 2-class task like left vs right hand is:

1. 25%
2. 100%
3. 0%
4. **50% (correct)**

8. Why do we test a model on data it never saw during training?

1. To make accuracy higher
2. **To check it works on new data (correct)**
3. To use less memory
4. To train faster

9. You shuffle the labels and accuracy stays at 85%. What does that mean?

1. The model is excellent
2. EEG is very strong
3. **Something is leaking or broken (correct)**
4. Nothing, that's normal

10. A 'brain' decoder only works when people blink. It's probably reading:

1. Motor cortex
2. Alpha waves
3. The P300
4. **Eye-movement artifacts (correct)**

11. A model trained on person A is tested on person B. It usually:

1. Can't run at all
2. **Does worse (correct)**
3. Does better
4. Does exactly the same

12. What is our project's main question?

1. How to read thoughts word by word
2. How to build a prosthetic arm
3. How to diagnose epilepsy
4. **How close cheap EEG gets to a lab-grade ceiling (correct)**
